

INSTALLATION INSTRUCTIONS

- For units with rechargeable batteries, charge the units before installation for 24 hours to start with fully charged batteries. To do this, connect the units to a power source of 10-30V 250 mA DC.
- Power packs are recommended to be charged for at least 1 hour at a power source 24V 2A DC.
- Cabling to vehicles needs to be done conform to the security instructions of the vehicles and their parts.
- The antenna side, i.e. the other side than the fixation side should never be blocked by a metal structure at a distance of 10 cm in front of it.
- When within a building, GPS positioning and mobile phone connection are possible in most but not all situations.
- The units are programmed to make transmissions according to activities, driving and not driving rhythms on vehicles. This implies that under other conditions, it is possible that the functioning is not correct.
- The GPS module and the modem need to be trained on the actual position and country. This implies that it can take some time after installation and after wake up before the units start working normally.
